# **Last Stone**

Bob and Sally play the following game. At the beginning of the game several stones lie in a box. The two players take stones in turns, and the player who takes the last stone wins. On each turn, a player may take  $\mathbf{T_i}$  stones for any  $\mathbf{i}$  between 1 and  $\mathbf{s}$ . For each number  $\mathbf{k}$  between  $\mathbf{m}$  and  $\mathbf{n}$ , inclusive, the game is played once with the box containing  $\mathbf{k}$  stones at the start of the game. Assuming both players play optimally, find out how many times Bob will win (Bob always moves first).

#### **Input Format**

First line of input contains 3 numbers  $\mathbf{s}$ ,  $\mathbf{m}$  and  $\mathbf{n}$ . Second line contains  $\mathbf{s}$  numbers  $\mathbf{T_1}$ ,  $\mathbf{T_2}$ , ...,  $\mathbf{T_s}$ .

#### **Constraints**

- $1 \le s \le 50$
- $1 \le T_i \le 100$
- Sequence **T<sub>1</sub>**, **T<sub>2</sub>**, ..., **T<sub>s</sub>** will be in strictly ascending order.
- $T_1 = 1$
- $1 \le m \le n \le 100000$

#### **Output Format**

Print a single number — how many times Bob will win.

#### Sample Input 0

```
3 1 5
1 3 4
```

#### Sample Output 0

4

## **Explanation 0**

If the box contains 1, 3 or 4 stones, Bob wins by taking them all on his first turn. If the box contains 2 stones, Bob is forced to take 1 stone, and Sally wins by taking the other one. If the box contains 5 stones, Bob takes 3 stones (leaving 2 stones in the box) and wins the game on his next turn.

#### Sample Input 1

```
1 1 100
1
```

#### **Sample Output 1**

50

### **Sample Input 2**

```
10 1 10
1 2 3 4 5 6 7 8 9 10
```

#### **Sample Output 2**

10				

# Sample Input 3

3 1 8 1 2 3

# **Sample Output 3**

6
